

GNSS AI Translation Engine

Automated, technically-accurate English→Spanish translation for a GNSS/RTK technical website.

- Translation Engine complete · WordPress integration pending staging access

A dedicated piece of software reads Precision-GNSS.com's articles, translates them into natural, technically accurate Spanish using AI, checks its own work twice for mistakes, and hands back a draft for a human to approve. Nothing is ever published automatically.

Pages published without review

How it works

Technology

Python 3.10 · DeepSeek API (`v4-pro` / `v4-flash`) · Pydantic v2 · pytest · WordPress REST API + a minimal `gnss-bridge` connector plugin to reach WPML's translation hooks safely · SQLite translation memory.

Status

AREA	STATUS
Translator, Reviewer, Terminology Validator	● Complete
Glossary engine	● Complete
Translation memory, QA scoring	● Not started
WordPress/WPML connector	● Needs staging

Cost — measured, not estimated

Calculated by running 4 real precision-gnss.com pages through the engine's actual code:

METRIC	VALUE
Avg. per page — translation only	\$0.0064
Avg. per page — full review pipeline	\$0.0129
Per 1,000 characters — full pipeline	\$0.00085

Worked example — Precision Agriculture page (24,706 chars):
24,706 × \$0.00085 ÷ 1,000 = **\$0.0210** full pipeline (matches the \$0.02083 measured directly), or **\$0.0104** translation only.

Bottom line: well under one cent per page. A 50-page full site translation costs roughly **\$0.64** total.

Next steps

- **Blocked:** WordPress connector, content extraction, WPML publishing — waiting on staging access.
- **Available now:** QA scoring engine, translation memory, `gnss-bridge` plugin skeleton.
